

Customizing Your Firenzie Logo

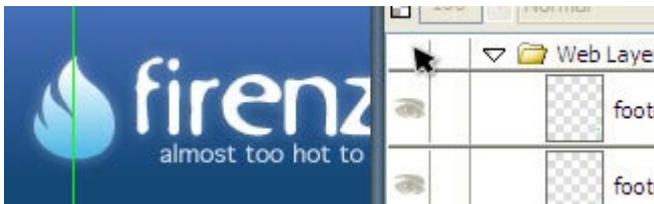

The following is a step by step guide to customizing your Firenzie logo image by replacing the logo text and reflection text with your own organization or company's name and logo.

In order to utilize the Fireworks Source PNG included with the Elemental template release, you will need Adobe Fireworks. The 30-day free trial of this software as well as more information is available [here at the Adobe website](#).

One of the first steps of customizing your new **Firenzie** template will undoubtedly be altering the logo text to reflect the name of your company / organization. RocketTheme makes this process a simple one by including both the Source PNG for the template, as well as font(s) used.

The most effective way to customize the logo is to use the included Source PNG file. When opened in Adobe Fireworks, this file contains all of the Layers in the design allowing you to tweak and change any of the image elements of the template design. The following steps will help you quickly get your new logo ready to go:

1. First, open the main Source PNG file in Adobe Fireworks (firenzie_source.png). On the right side, you will notice a taskbar named **Layers**. Inside this column, a list of elements within the source will appear, divided into folders. The first is Web Layers which controls the green slices on the page that are used to export the images. Click the eye which is immediately left to the folder name **Web Layers** to make it invisible. This allows use to edit the logo.

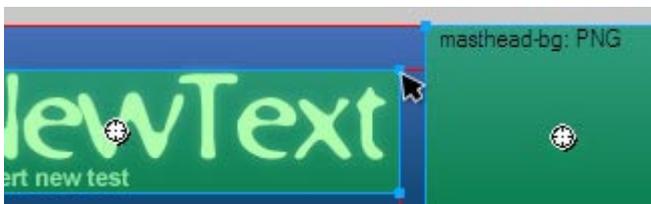

2. Next, double click on the logo which should be position in top-left. This will activate the text tool so you can edit the element. Highlight the entire text box with your cursor and type your text instead(such as your company name.)

We do the same for the text underneath, double click on this text which should be situated below the logo.. This will activate the text tool so you can edit the element. Highlight the entire text box with your cursor and type your text instead(such as your company slogan.)

3. Since the new logo text is larger than the slice, we must make the slice larger. Left click and drag on the right corner to the new dimensions. However, you will notice that the slice **masthead-bg** now overlaps the logo, simply left click and move to the right so it is no longer overlapping. We now must reactivate the web layers/slices to be able to export the logo out of Fireworks. Back in the right taskbar, click the empty, white cell next to the web layers folder where the eye was visible before. This will activate the eye icon and the green slices on the source screen.

4. Right click on the green slice that is situated above your new logo. A popup menu should appear with numerous options. The value we want to deal with is "Export Selected Slice...". As the name suggests, this option will export/save this slice only out of the entire source window. You will be sent to another window where you need to save the slice onto your local computer.

Uploading your new logo

Once you have successfully edited then exported your new logo, you will need to upload it to your server. This process is best done via a FTP client such as [Filezilla](#)

1. Open your FTP client on your local computer.
2. Login to your web server where **Firenzie** is installed.
3. Navigate to the `/templates/rt_Firenzie/images` directory.
4. Upload **logo.png** to this directory (You may need to browse on the local panel in the FTP client to find where you have exported your logo).
5. Clear your browser cache before viewing such as using the keyboard commands on Windows, **Ctrl+F5**.

Ensure that you are uploading the correct logo to avoid confusion if it does not change. Also take into account hosting permissions. Sometimes, hosters which are not designed for Joomla may have permissions not suited for the setup, thus, the upload will not be complete. In this case, contact your hosting provuder.
