

IE6 PNG Fix

If you have ever opened a webpage with a transparent PNG in Internet Explorer 6, you will see an obvious problem. The images do not appear transparent but adopt a light blue background, which is unsightly to say the least. This is the purpose of the PNGfix, to allow transparent PNG images to work correctly in the web browser Internet Explorer 6. A common way around this is to use a range of different Joomla! extensions which can be applied to your site. However, this is already built in to new RocketTheme templates (the fix already provides other solutions to various other IE6 issues). The author of this new PNGfix is Drew Diller.

All templates, starting from January 2009 have the fix outlined on this page.

How do I use the PNGfix?

To apply the PNGfix to a particular image, all you need to do is add a class, png. We have an example of image HTML code below:

```

```

Now add class="png" to the code such as:

```

```

******Note:***

Uninstall all other PNGfixes before using the template version, that includes plugins you may have installed into Joomla! as they will conflict with the template fix.

How to remove the PNGfix

If you wish to remove the PNGfix from the template, you have to remove the file and remove the reference from the rt_head_includes.php file. The file is called DD_belatedPNG.js and is located in the /templates/rt_affinity_j15/js directory. You would then remove the following from the rt_head_includes.php file:

```
<script src="<?php echo $this->baseurl; ?>/templates/<?php echo $this->template?>/js/DD_belatedPNG.js"></script>  
<script>  
    DD_belatedPNG.fix('.png');
```
